

Piston pump unit

Product series KFG

For fluid grease and grease

For use in SKF MonoFlex and SKF ProFlex centralized lubrication systems

Features:

- Delivery rates: 0.8 to 15 cm³/min
- Fluids delivered: Fluid grease and grease
- Reservoir capacities: 2 to 20 kg
- Patented grease follower plate system for position-independent application (e.g. rotary application in wind energy systems)
- Integrated fill level monitoring
- Control unit that can be integrated
- For use in vehicles, Industrial and wind energy systems
- The commercial vehicle version has type approval pursuant to ECE-R 10

Advantages:

- Reliable: due to sturdy materials, very durable components and designs for extreme conditions (with positively driven pump elements)
- Application-oriented: individual designs through user-friendly product customizer
- Versatile: can be used as a single line (SKF MonoFlex) and as a progressive pump (SKF ProFlex)
- Safe: through fill level monitoring, lubrication system monitoring, pressure relief and control unit

**Important information on product usage**

SKF and Lincoln lubrication systems or their components are not approved for use with gases, liquefied gases, pressurized gases in solution and fluids with a vapor pressure exceeding normal atmospheric pressure (1 013 mbar) by more than 0,5 bar at their maximum permissible temperature.

KFG piston pump unit

Introduction

The KFG pump unit is an electrically driven piston pump. Its core is comprised of a drive shaft with an eccentric that drives up to three pump elements. Various designs make it possible to accommodate this sturdy and proven principle of operation to different circumstances.

The pump is comprised of four main components: Housing with pump elements, reservoir with fill level monitoring, internal control units and attachments. The housing integrates the motor, the drive shaft with an eccentric and up to three pump elements for delivering the lubricant. Positively driven pump elements should be used in order to maintain the delivery rate in areas with extremely low temperatures or in applications where an increased influence of dirt is unavoidable.

The reservoir is used for storage of the lubricant. It is available in eight sizes and two variants for stationary utilization or with grease follower plate technology for utilization in any position. The internal control units monitor the switching on and off of the pump. In addition, they enable the evaluation of piston detector, pressure switch and fill level signals. A variety of attachments permit the filling of the reservoir, protect the pump (pressure limitation valve), relieve the system (only when used in single-line systems) or enable the uncomplicated connection of the pump to the centralized lubrication system.

Fields of application

Vehicle

It is particularly with changing operating conditions that vehicles must function reliably. KFG piston pump units are the heart of SKF centralized lubrication systems for vehicles. They supply all of the connected lubrication points in an optimum manner and thus reduce service and repair costs but up to 25%.

Industry

Friction, e.g. in machine tools, causes great wear and thus wastes valuable natural resources. SKF centralized lubrication systems with KFG pump units reduce friction and thus considerably extend the service life of machine tools, for example.

Rotary application

Centralized lubrication systems such as SKF WindLub with the KFG pump unit for rotary application reduce the wear on modern wind energy systems and thus ensure a long preservation of value. They shorten the time required for repair and lengthen the repair intervals. That saves money.

KFG piston pump unit

Functional description in SKF centralized lubrication systems

SKF MonoFlex – Single-line centralized lubrication systems

The SKF MonoFlex System is comprised of:

- Pump unit with pump element(s) and relief valve
- Lubricant lines
- Single-line distributors
- Pressure switch for pump control unit and monitoring

When the pump motor is turned on, the pump element suctions the lubricant out of the reservoir and conveys it through the relief valve to the lubrication line. Through this it flows to the single-line distributors. There it is metered and forwarded to the lubrication points during the pump runtime. Once the pressure build-up is completed, the relief valve, controlled by a pressure switch, switches over. As soon as the main line is relieved of pressure, the system is ready for the next lubrication cycle

SKF ProFlex – progressive centralized lubrication systems

The SKF ProFlex System is comprised of:

- Pump unit with pump component(s)
- Lubricant lines
- Progressive feeders
- Optional piston detectors for function monitoring

When the pump motor is turned on, the pump element suctions the lubricant out of the reservoir and conveys it to the lubrication line. Through this it flows to the progressive feeder. There it is divided up, depending on how much lubricant is required at the lubrication points to be supplied.

In progressive systems with master and secondary feeders, the lubricant is first delivered to the master feeder. The master feeder distributes the lubricant to the secondary feeders according to their individual volume requirements. From there, the lubricant flows to the lubrication points. Piston detectors can be connected to the function monitoring. The function monitoring of a lubrication system with the aid of a single piston detector is possible, thanks to the positively driven distribution of the lubricant typical for progressive systems.

KFG piston pump unit

Main components

Pump housing

The housing of the KFG pump unit is made of sturdy aluminum. Integrated within are the electric motor, the power supply unit (only with 230 V AC variant), the drive shaft with eccentric and one to three pump elements. The eccentric converts the rotational movement into a stroke movement of the pump element. The pump element pushes out lubricant during its forward movement and suctions in new lubricant from the lubricant reservoir during its retraction movement.

In the design for the vehicle and industry sector, the lubricant reservoir is filled through a conical head nipple on the pump housing. In addition, two different control units (IG502-2-I and LC502) can be integrated as optional equipment. Their displays are attached in a readily accessible manner to the front side of the pump housing. Basically speaking, the pump unit is available with three voltage keys: 12 V DC, 24 V DC and 230 V AC. KFG pump units with control unit, a 230 V power supply unit or with mechanical fill level switch have a deep bottom (foot). The overall dimensions are changed as a result.

Pump elements

Pump elements deliver the lubricant to the lubrication points or distributors through lubrication lines. Five pump elements for delivery rates of from 0.8 to 5.0 cm³/min are available for selection in two designs:

- with spring-return piston
- with positively driven piston

In many application instances, the pump element with spring-return piston is the correct choice. The pump element with positively driven piston was developed for use in extremely cold environments (to -30 °C).

or for high-viscosity lubricants. Up to three pump elements can be installed in the KFG pump unit. The possible attachment positions are located on the left (1), at the front (2) and on the right (3) on the pump housing. The lubricant outlet on the pump element has an M14x1.5 female thread for connecting lubrication lines or valves. If no pump element is installed, then the outlet of the pump housing is sealed with a screw.

Note

If more than one pump element is installed in a KFG pump unit for an SKF MonoFlex system, then their outlets will be consolidated externally to form one main lubrication line. The total delivery rate is then derived from the sum of the respective delivery rates of the individual pump elements.

Marking of the pump elements

Model	Spring-return	Positively driven
Delivery rate* [cm ³ /min]	Number of the marking grooves on the head of the pump element	Labeling
0,8	4	-
1,3	3	J-3
1,8	2	H-2
2,5	1	G-1
5,0	0	L-0

* The specified quantities refer to grease of NLGI class 2 at 20 °C and a back pressure of 50 bar.

KFG piston pump unit

Main components

Reservoir

Two different reservoir types exist for the KFG pump unit: one for stationary and one for rotary application. A grease follower plate system patented by SVK is to be found in the lubricant reservoir of the units for rotary application. A spiral spring assembly is attached to the grease follower plate. This presses the follower plate onto the lubricant. As a result, the lubricant is always available at the pump element, independent of the position of the unit. The filling of this reservoir variant is carried out through a quick-action coupling on the reservoir cover in accordance with the "First In - First Out" principle. This avoids having old grease in the lubricant reservoir. The initial filling of the reservoir is made by SKF. In the reservoirs without grease follower plate technology, for industry and vehicle applications, the lubricant is worked by an agitator. This avoids air pockets and improves pumpability.

Fill level monitoring through mechanical fill level switches

The mechanical fill level switches are mounted on the agitator. The grease resistance causes them to pivot downwards when the reservoir is filled and the agitators rotate. When the minimum fill level is reached, the pressure of the grease is reduced to the rocker switch.

Fill level monitoring through capacitive proximity switches

Capacitive proximity switches are contact-free sensors that react with an electrical switching signal when a medium approaches.

Fill level monitoring using cylinder switches

In the case of cylinder switches, contactless solenoid switches are used. They measure the change of the magnetic field and convert this into a digital signal. In the case of the KFG pump, they are used solely in units that have a grease follower plate.

The filling of the variants without grease follower plate technology takes place through the housing, as is described on page 6.

Reservoir capacities of from 2 to 20 kg are available for vehicles and industrial plants and reservoir capacities of from 4 to 15 kg for rotary applications.

Depending on the field of application, three variants exist for monitoring the fill level in the lubricant reservoir: capacitive proximity switches, mechanical fill level switches and cylinder switches.

Cylinder switches are suitable for the reservoir model with grease follower plate. The capacitive proximity switch is suitable for stationary application with grease and fluid grease of the NLGI classes 1, 0, 00, and 000. The mechanical fill level switch is to be used for the stationary application with grease of NLGI class 2.

It pivots back and thus interrupts the contact to the solenoid switch. The mechanical fill level switches are used only in stationary KFG units for fill level monitoring of the lubricating medium of NLGI class 2 grease. A version with signal smoothing is also available for the evaluation of the signal with external control units.

They are used in KFG pump units for minimum fill level monitoring of the lubricating medium fluid grease and grease up to NLGI class 1.

When several cylinder switches are used various switching points such as Minimum, Maximum of Fill level pre-warnings can be monitored by the detection of the position of the grease follower plate.

SKF

KFG piston pump unit

Main components

Internal control unit IG502-2-I

The control unit IG502-2-I with control display can be integrated in the pump housing and controls the turning on and off of the KFG pump by means of interval times and pump runtimes. It enables the fill level monitoring of the lubricant reservoir and the evaluation of a piston detector signal (setting of the control unit when a signal is expected from the piston detector during the runtimes: COP=CS). It is suitable exclusively for the monitoring of SKF ProFlex systems.

Note

Legend of the abbreviations for the programming of the control units:

- COP:** Cycle Off Pressure
(main line pressure off)
- PS:** Pressure-Switch
(pressure switch)
- CS:** Cycle-Switch
(piston detector)

Internal control unit LC502

The control unit LC502 offers the same range of functions as the IG502-2-I. In addition, it enables the control of single-line systems (SKF MonoFlex) through the evaluation of a pressure switch signal (setting of the control unit, if a signal is expected from the pressure switch during the runtimes): COP=PS).

With the LC502, it is possible to monitor two piston detectors in progressive systems (SKF ProFlex) simultaneously. (Setting of the control unit, if a signal is expected from the piston detector during the runtimes: COP=CS.)

Pump runtimes and interval times

In the control device Pump run- and pause times can be preset from factory. To make this possible a corresponding code letter

from the following table has to be entered in the order code on page 11.

Runtimes IG502-2-I/LC502

Pump runtime * [min]	Letter
2	A
2,5	B
3	C
3,5	D
4	E
4,5	F
5	G
5,5	H

12	S
13	T
14	U
15	V
16	W
17	X
18	Y
20	Z

* further pump runtimes on request

Interval times IG502-2-I/LC502

Pump pause time * [h]	Letter for control unit without monitoring	Letter for control unit with monitoring
0,5	A	N
1	B	O
1,5	C	P
2	D	Q
2,5	E	R
3	F	S
3,5	G	T
4	H	U
5	I	V
6	J	W
7	K	X
8	L	Y
9	M	Z

* further pump pause times on request

Note

If during the pump runtime neither a pressure switch nor a piston detector signal is expected, then the control unit should be set as follows: COP=off.

If a pressure switch signal is expected, then the control unit should be set as follows: COP=PS.

If a piston detector signal is expected, then the control unit should be set as follows: COP=CS.

KFG piston pump unit

Main components

Pressure restriction valve

In order to prevent an excessive operating pressure in the system, a pivoted pressure restriction valve should be attached. If the operating pressure exceeds the cracking pressure of the pressure restriction valve, then the valve will open and the lubricant can escape. The pressure restriction valve is used primarily in progressive systems. One can select among variants with SKF plug connectors, straight connector and with G 1/4" female thread.

Pressure relief valve with integrated pressure restriction valve

The valve offers both a pressure regulating and a pressure relief function. SKF MonoFlex systems require pressure relief for the system in order to conclude the metering of the distributors and thus to enable a new lubrication cycle. The pressure regulating function protects the system against excessive operating pressure. This valve is therefore used exclusively in single-line systems. One can select among variants with SKF plug connectors, straight connector and adapter for G 1/4" female thread.

Socket for filling cylinder

For industry and vehicle applications, one of the three lubricant outlets of the pump can, as an option, be equipped with one suitable filler socket instead of with one pump element, in order to fill the unit using a filling cylinder (cartridge).

Fittings

A variety of different fittings with the male thread M14x1.5 are available for selection for the connection of the pump element to the lubrication lines of the centralized lubrication system. One can select among cross sections 6, 8, 10 and 12 mm in size.

If a G 1/4" connection is required, then a special adapter must be used. Additional information regarding fittings and accessories are to be found in the leaflet **1-0103-EN**.

KFG piston pump unit

Accessories

Filler coupling

As an alternative to a conical head nipple, the units for industrial or vehicle applications can also be equipped with a filler socket in order to fill it with a filling pump, e.g. the manual drum pump. A corresponding coupling socket and a hose socket must be mounted on the filling pump.

Filler socket

Filling coupling Part A

Description	Order number
Filler socket with sealing ring	24-9909-0244

Coupling socket

Filler coupling Part B

Description	Order number
Coupling socket	995-001-500

Hose socket

Filler coupling Part C

Description	Order number
Hose socket: ø13 mm	857-760-007
ø16 mm	857-870-002

Filling cylinder

For industry and vehicle applications, a filling cylinder can also be optionally used to fill the pump unit through one of the lubricant outlets. To accomplish this, a filler socket must be configured in the order code in place of a lubricant outlet.

Filling cylinder

Description	Order number
Filling cylinder (socket for filling cylinder w must be configured on KFG pump in the order code on page 11)	169-000-171

Manual drum pump

The manual drum pump is for simple filling-up of the KFG piston pump unit. It is available in the designs with and without trolley and is suitable for NLGI class 1 and 2 greases. The delivery rate of the drum pump is approx. 40 cm³/stroke.

Drum pump

Description	Order number
Drum pump with running gear: For 25 kg drum	169-000-042
For 50 kg drum	169-000-054
Drum pump without running gear: For 25 kg drum	169-000-342

KFG piston pump unit

Accessories

IG502-2-E external control unit

The IG502-2-E is an external control unit with a control display. It controls the turning on and off of the KFG pump by means of interval and pump runtimes. Furthermore, it enables the fill level monitoring of the lubricant reservoir and the evaluation on one piston detector signal. In addition, one can operate the pump unit with it, even from a short distance, e.g. from the cab of a vehicle. It is suitable only for SKF ProFlex systems.

External control unit

Description	Order number
External control unit	IG502-2-E+912 (control voltage 12 V)
	IG502-2-E+924 (control voltage 24 V)

Retaining ring and drilling template

For all KFG units with reservoir capacities up to and including 6 kg, a special drilling template exists as an installation aid made of self-adhesive foil. In addition to that, a stabilizing retaining angle is also available for vertical installation.

Retaining ring and drilling template

Description	Order number
Self-adhesive drilling template	951-130-115
Pump retaining plate	881-290-430

Electrical accessories

The T plug is suitable when additional connectors are required, e.g. for a separate indicator lamp.

Electrical accessories

Description	Order number
T-plug M12x1 with two outgoing cables (socket M12x1)	179-990-700

Pressure gauge

Reed pen pressure gauges with glycerin filling are available for visual documentation of the pressures in the SKF centralized lubrication system. The parts which come into contact with the medium are made of copper alloys. These pressure gauges are suitable for highly dynamic pressure loads and vibrations. The necessary accessory parts for fastening are to be found in the leaflet 1-0103-EN.

Pressure gauge

Description	Order number
Pressure gauge, complete: 0 to 250 bar 0 to 400 bar	169-125-000.U1
	169-140-001.U1
Pressure gauge screw union: for ø 6 mm tubing for ø 8 mm tubing for ø 10 mm tubing for ø 12 mm tubing	471-106-163
	471-108-163
	471-110-163
	471-112-163

KFG piston pump unit

Special designs

KFG with CAN bus control unit (KFGC)

The KFGC (CAN bus) variant is based on the KFG series and has an integrated CAN bus control unit (LC-CAN5000). The control unit with the CAN bus interface SAE J1939 permits the integration of the lubrication system in the CAN bus and thus enables the input and evaluation of a large number of parameters for the control unit and monitoring of the system. It can however also be used as a stand-alone solution and be connected to a PC via a CAN bus plug/CAN bus adapter or through an infrared interface.

Interesting for:

- all those who use CAN bus and who would like to enter, display and evaluate the lubrication system data at a central location
- all those who require individual settings and monitoring of up to four independent valves and/or lubrication circuits (complex systems)
- all those who wish to call up the error log through the PC

Result:

Implementation of tailored lubrication concepts for each lubrication circuit in the lubrication system (independent and according to need).

KFGC

KFGC
(view from below)

Note

For inquiries regarding possible variants and designs, please contact an SKF Lubrication Systems representative.

KFG sea water-resistant

Basically, all KFG variants are available in sea water-resistant versions. Individual components for protection against corrosion (corrosion class C5-M) are coated for this purpose and combined with stainless steel components.

Note

For inquiries regarding possible variants and designs, please contact an SKF Lubrication Systems representative.
